A message to parents, grandparents and care givers:

This story teaches children how to be lead-safe.

Lead dust from cracking or peeling paint can poison children.

Children under six are in greatest danger because they may play on floors or dirt which may contain lead dust and they tend to put their hands in or near their mouths. It only takes a tiny amount of lead dust to poison a child.

A lead poisoned child may complain of headaches or stomachaches or may just not act right. The only way to tell if your child is lead poisoned is to have his or her blood tested as early as possible.

You can help your child be lead-safe by making sure he or she washes their hands before eating and before bedtime. Also, feeding them foods high in calcium or iron and low in fat help keep lead from being absorbed.

Bill Landis- Illustrator

and U.S. EPA Region 7

***For allowing us to share Charlie
with the children of Region 5.***

April 2000

"Where are you going, Charlie,"
Wooly Worm asked?

"I'm going to town to tell children about lead-based paint."

"What do we need to know,
Charlie?"

"How to protect yourselves from lead poisoning," said Charlie.

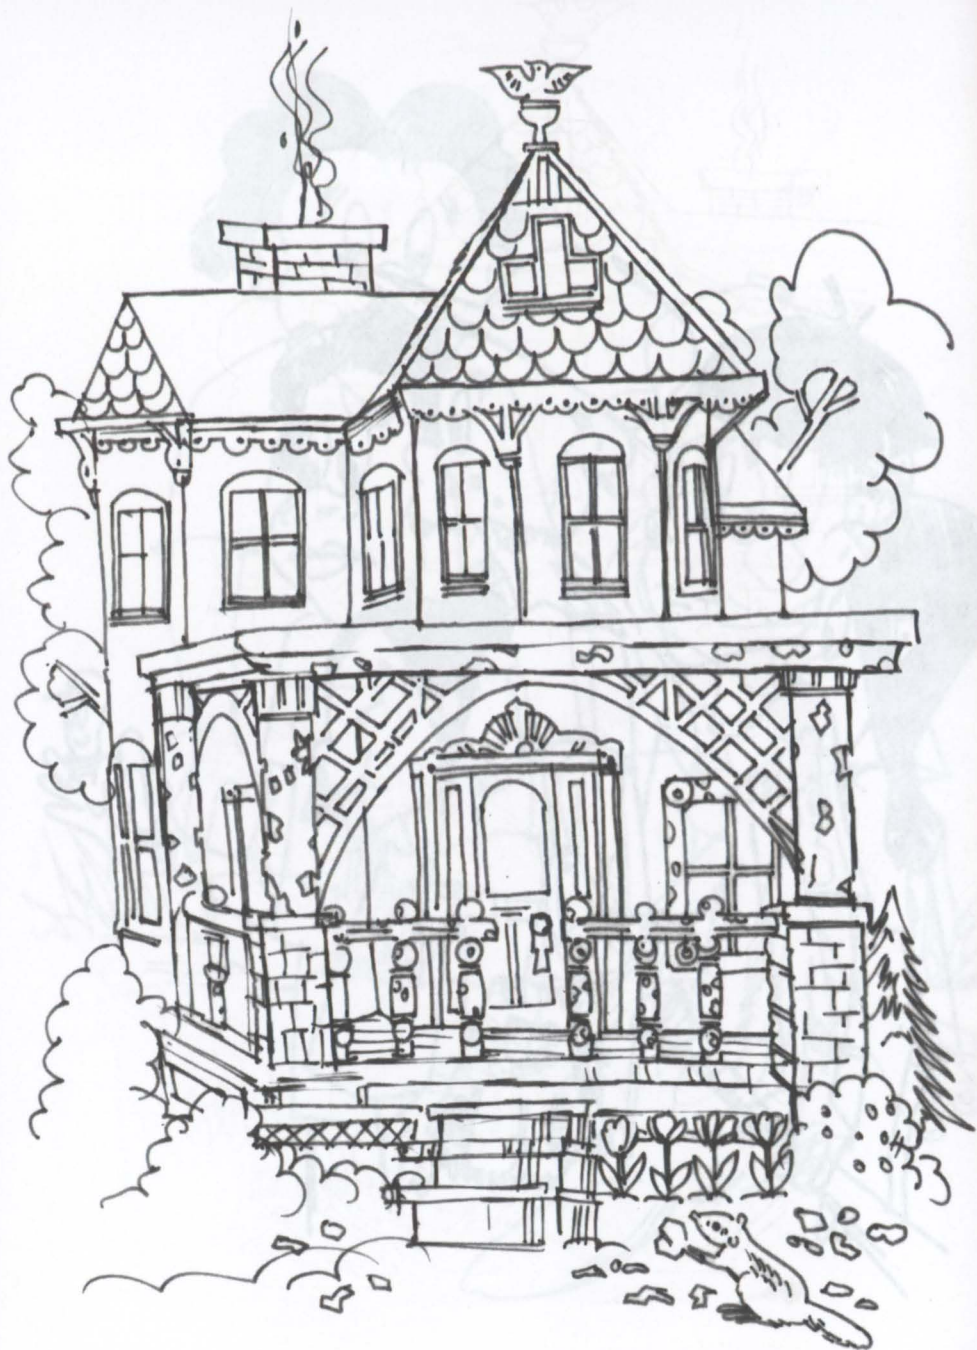

"Because lead can
make children sick."

"How do we protect ourselves?"

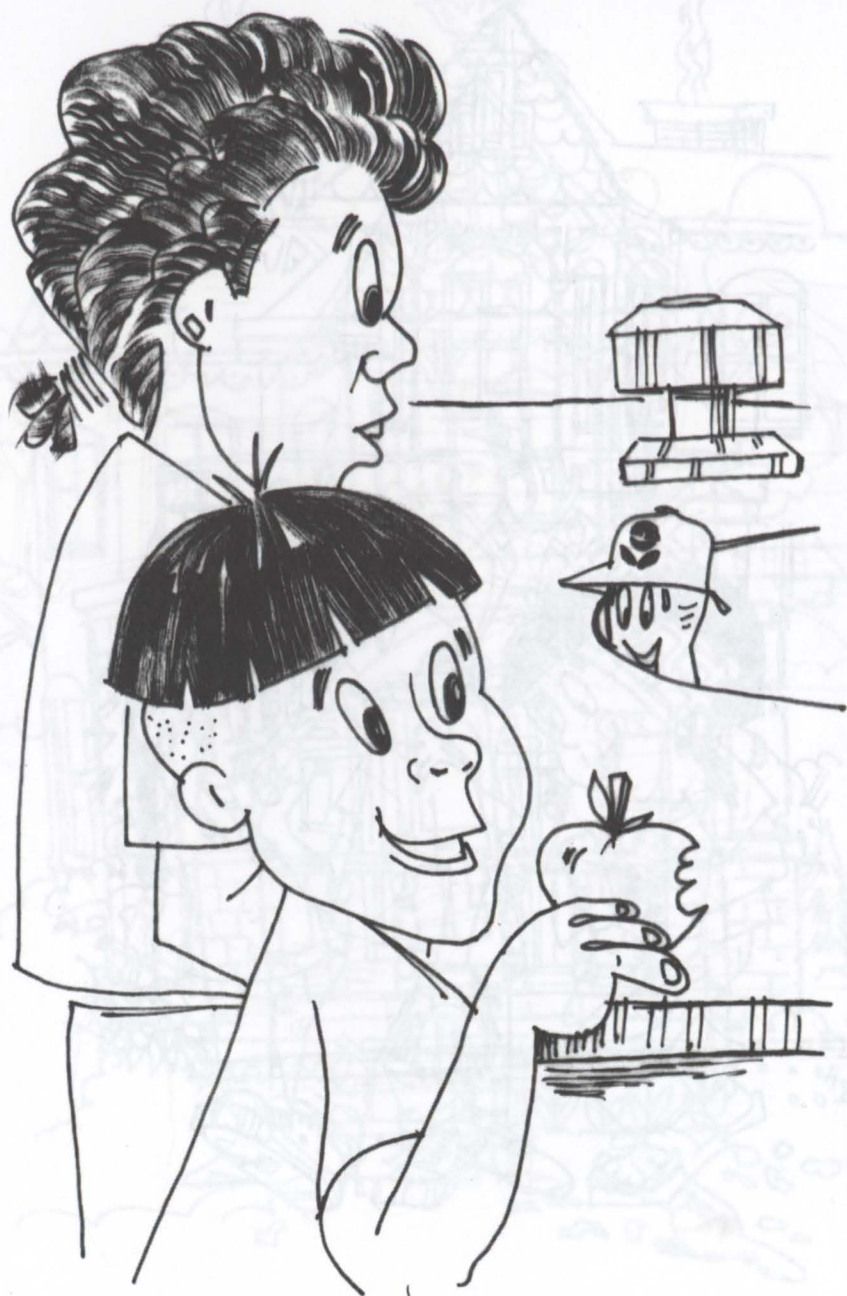

"Stay away from peeling paint,"
Charlie answered.

"Old paint has lead in it.
It gets in the dirt."

"When you play in the dirt
you get lead on your hands."

"So wash your hands often,"
said Wooly Worm.

"After you play and before
you eat," Charlie said.

"Eat good food," Charlie said.

"We want you to be healthy
"Milk, meat, fruits and vegetables
are really good for you!"

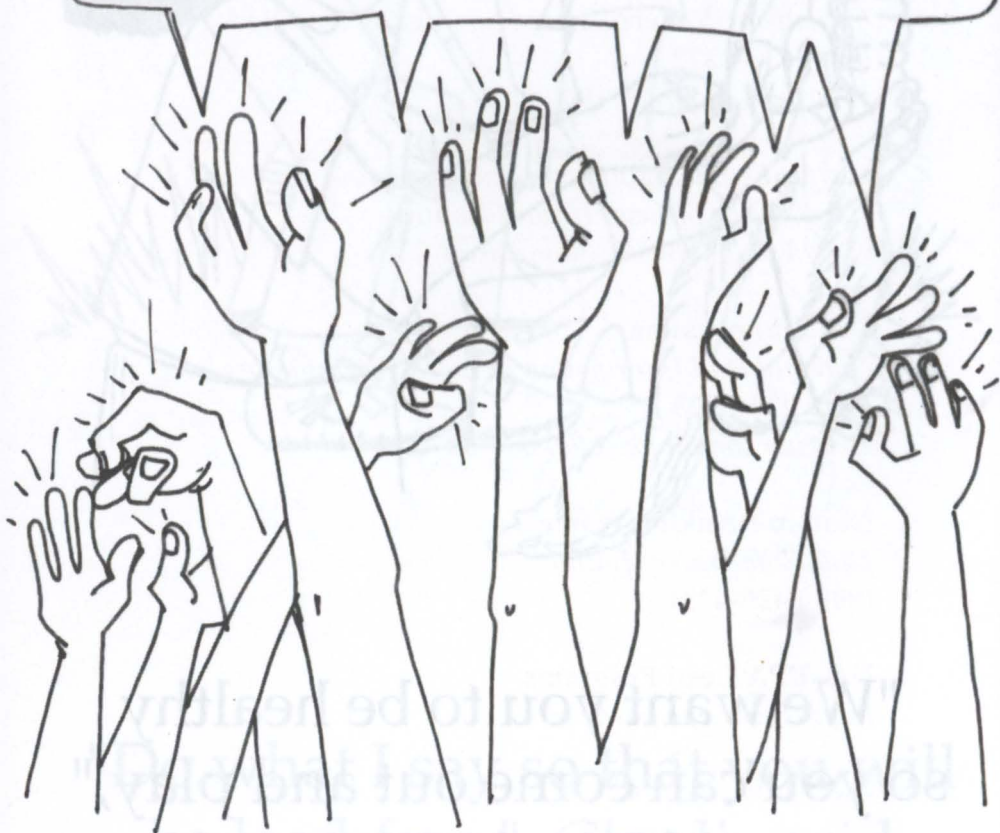

"Do what I say so that you will
be lead-free," Charlie said.

"We want you to be healthy
so you can come out and play,"
said Wooly Worm.

**NOW WE KNOW
HOW TO BE
LEAD-FREE!**
